Assignment: Project Repository Setup

Objective: Setup your project repository and perform basic research.

Learn about and customize your repository by doing the following:

1. Create a GitHub repository. Add me to your repository and authorize me to contribute.
2. Modify the readme part of your repository to describe the nature of your repository.
3. Customize the "issues" by specializing them, such as the types and colors of tags. Document your these choices on Wiki.
4. Create issues and assign them to the appropriate persons (may be yourself).
5. Create a page to document the following **research** you will perform:
   - Study git as a version management system. There are many guides and videos you can watch. I recommend Git For Ages 4 And Up (`https://youtu.be/1ffBJ4sVUb4`). It is long, but very good.
   - Examine Wikidata (`https://www.wikidata.org`). Perform some tests with its API.
   - Document what you have learned by creating a research section of your GitHub repository. **Use Wiki Markdown language and use your own words**! Maintaining your Wiki will be a constant part of this course.
6. Post the link to your GitHub repository as a response to this assignment.
7. Send me a link to your GitHub to discord by speciying your full name and the link.

Notes:

- You must document using the wiki system and not upload external document.
- Keeping your project repository up to date is a task of constant gardening. You must keep it up to date on regular basis.
